

Blueprints Supply Desk

One-page repo summary

Repo-grounded summary

WHAT IT IS

External-facing supply request portal for partner organizations. The repo shows a FastAPI backend, a React frontend, Google Sheets-backed inventory and requests, and email notifications for request events.

WHO IT'S FOR

Partner organizations or clinics that need to browse available supplies, submit requests, and track request status.

WHAT IT DOES

- Browse consolidated supply inventory from ``/api/supplies``.
- Search and filter items by category and subcategory in the React UI.
- Show live availability tags from ``/inventory/availability``.
- Store an org session in ``sessionStorage`` for repeat visits.
- Build a cart and submit org requests through ``POST /requests``.
- View past requests and per-line statuses in the My Requests tab.
- Send org confirmations, HQ alerts, and status update emails.

HOW IT WORKS

- Frontend: Create React App app in ``my-dashboard/`` calls backend endpoints with ``fetch``.
- Backend: FastAPI app in ``main.py`` exposes inventory, request, and availability APIs.
- Data store: ``gsread`` reads Sheet 1 for inventory and writes request rows to a ``Requests`` worksheet.
- Email service: ``app/services/email.py`` sends Gmail SMTP emails for confirmations, HQ alerts, and status updates.
- Dev mode: ``USE_SAMPLE_DATA=1`` serves ``sample_inventory.json`` and skips sheet writes and emails.
- Prod path: after ``make build``, FastAPI serves the built React app from ``my-dashboard/build/``.

HOW TO RUN

- Copy ``env.example`` to ``env`` and fill in Google and Gmail values.
- Run ``make install``.
- Run ``make dev``.
- Open ``http://127.0.0.1:8000`` for the API and ``http://localhost:3000`` for the frontend.

Repo evidence: README.md, main.py, app/services/email.py, my-dashboard/src/App.js, Makefile, .env.example
